Executive Summary

Appointment	Curtins were instructed by Layer Studio to undertake a Preliminary Risk Assessment of a site known as The Iron Line, Millom, Cumbria, LA18 4LB. The site is approximately 58 Ha in size centred on National Grid Reference SD 17877 79009. It is understood the project comprises e**rection of visitor centre with café/shop, group room, staff/volunteer, toilet facilities and car park; consolidation, repair and installation of interpretive sculpture to Towsey Hole Windmill; refurbishment of existing Tern Island hide; new bird hides, pathways, gateway features and street furniture; enhancement of wildlife habitats; associated landscaping and drainage infrastructure; and maintenance of byway with restricted vehicular access**.
Current Site Status	The site is a Site of Special Scientific Interest and comprises of RSPB Hodbarrow, and southern side of the Redhills Quarry. The Nature Reserve park covers the majority of the site and the Redhills Quarry may extend on to the North East of the. A sea wall is present bounding the south of the site, extending from east to west. Heritage and historic structures are present across the site such as the Hodbarrow Beacon & Lighthouse.
Geology	BGS mapping indicate the site is underlain by made ground, worked ground and infilled ground. Landfills are also recorded on the site. No superficial deposits are indicated to underly the site. The site is underlain by bedrock of Limestone formation, Martin Limestone formation, Low Furness Basal Formation and the Dalton Formation depending on area. The site is located in a low to high probability radon area where <1% to 30% of homes are estimated to be at or above the Radon Action Level. Development areas should be assessed individually with some areas likely to require protection measures and others will not. A BGS radon report should be procured for proposed buildings.
Site History	In the earliest historical mapping (mid 1800s) the site was largely undeveloped comprising predominantly marshland and part of the Duddon estuary with evidence of initial mineral extraction. The industrial premises of Redhills Quarry (North East) and Hodbarrow Iron Mine (South East) expand through the turn of century with various 'pits' and mining infrastructure and features evident (mineral railway, reservoirs, spoil heaps). An outer sea barrier was constructed in the south of site by 1924 with marshland and ponds then occupying the area inside to sea wall to the west/north of site. By 1968 the mine was closed, the extensive rail network within the site was dismantled and buildings are disused. By 1986 the majority of the site was converted into a nature reserve. The remaining buildings associated with the mine and quarry workings were dismantled, the majority of spoil and slag pits were seemingly removed, reservoirs throughout the site were infilled.
Potential Geohazards	The following geohazards have been identified: • Potential for soft / loose organic soils associated with marshland with a low bearing capacity and potential for excessive settlement. • Potential for Made Ground associated with mining / structures. Made Ground is considered to be an unsuitable founding stratum, due to its poor geotechnical properties, variability, and compressibility. • Potential for unrecorded mine shafts. • Infilled pits / reservoirs may contain deep Made Ground which may preclude the use of shallow foundations. • Potential for buried infrastructure and obstructions associated with structures such as reservoirs and the railway. • Potential for subsidence / collapse associated with underground iron mining. • Potential for aggressive ground conditions with regards to chemical attack on buried concrete. • Potential for fractured bedrock associated with fault zones.
Initial Ground Contamination Assessment	The risk from Made Ground posed to the site's end-users and construction workers is considered to be **Moderate** based on nature of uses of the site including mineral extraction and landfilling. The risk posed to groundwater and surface water is considered to be **Moderate**. The risk posed to site end-users from ground generating gases arising from organic/putrescible soils and mine workings is considered to be **Moderate.**
Recommendations	The following recommendations are made for works advance of any development works taking place. • Undertake a Detailed Mining Risk Assessment for the site/ development areas to categorise and understand the extent of mining risk pertaining to the development area. As part of this mine plans and other mining records pertinent to the proposed development site should be obtained where possible; • Depending on the findings of the Detailed Mining Risk Assessment, undertake an intrusive ground investigation to determine the extent of shallow mining under the footprint of the proposed development area; • Undertake an intrusive ground investigation to determine foundation solutions and other geotechnical design parameters. • Undertake an intrusive ground investigation to determine extent of contamination, for soil and water; • Undertake a GQRA as part of the ground investigation; • Procure BGS radon report specific to areas of the site where buildings are proposed; • Undertake ground gas monitoring over a period of three months for potential hazardous gases; • The Mining Risk Assessment should be further updated following completion of an intrusive investigation. • Subject to findings of ground investigation, undertake a Remediation Strategy outlining required remedial actions and subsequent validation/completion report.

Appendices

Appendix A **Drawings**

Appendix B **Envirocheck Report**

Appendix C **Qualitative Risk Assessment Rationale**

1.0 Introduction

1.1 Project Background

Curtins were instructed by Layer Studio to undertake a Phase 1 Preliminary Risk Assessment of a site known as The Iron Line, Millom, Cumbria, LA18 4LB.

The location and extent of the site is shown in *Figure 2.1* on the following page. It is understood the project comprises erection of visitor centre with café/shop, group room, staff/volunteer, toilet facilities and car park; consolidation, repair and installation of interpretive sculpture to Towsey Hole Windmill; refurbishment of existing Tern Island hide; new bird hides, pathways, gateway features and street furniture; enhancement of wildlife habitats; associated landscaping and drainage infrastructure; and maintenance of byway with restricted vehicular access.

Proposed development plans are enclosed in Appendix A.

1.2 Scope of Services

The Preliminary Risk Assessment is intended to provide an overview of the geological and historical setting of the site of interest, taking into consideration the sites iron mining legacy and potential contamination. The report provides an assessment of the risks that could be presented to site end users and the built environment and an initial Conceptual Site Model.

Additionally, the Preliminary Risk Assessment makes recommendations for the extent and nature of any additional work required to the further assess or mitigate the environmental and geological risks.

Proposed development drawings for the site are included in *Appendix A*.

2.0 Current Site and Surrounding Area Details

2.1 Site Location and Current Details

Site use, location and description are shown below in *Table 2.1* and *Figure 2.1*.

Table 2.1 – *Site Details*

Site Address	The Iron Line, Millom, Cumbria, LA18 4LB
National Grid Reference	SD 17877 79009
Area of Site	Approximately 57.69 Ha
Current Site Use and Description	The site comprises of RSPB Hodbarrow and southern side of the Redhills Quarry (owned by Cumbria County Council). The Nature Reserve park covers the majority of the site and the Redhills Quarry may extend on to the northeast of site. A sea wall is present bounding the south of the site, extending from east to west. Heritage and historic structures are present across such as the Hodbarrow lighthouse and Hodbarrow Beacon. The site is a Site of Special Scientific Interest (SSSI), Ramsar Site, Special Protection Area and Special Area of Conservation.

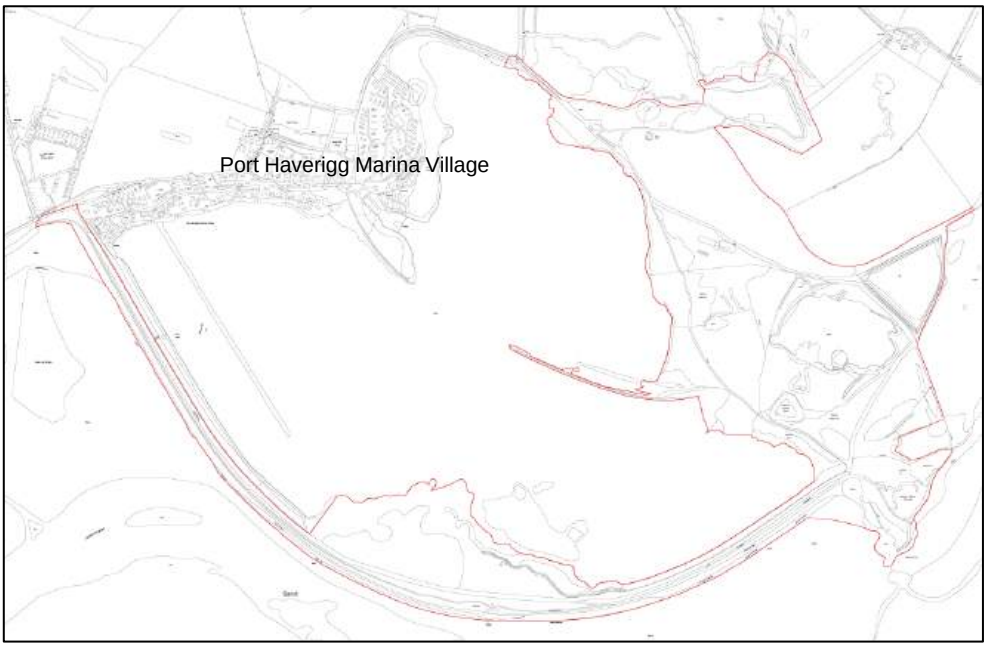

Figure 2.1 *– Site Location Plan (site boundary shown in red).*
Extract from received Site Location Plan, shown in ***Appendix A****.*

It should be noted that the Envirocheck report was procured for a slightly different site boundary, Reappraisal of the Envirocheck report has been undertaken with respect to the current site boundary shown in Figure 2.1.

2.2 Surrounding Area Details

The following information was established through undertaking an environmental database search (Envirocheck report (Ref.1) included in *Appendix B*).

Table 2.2 – *Surrounding Land Uses*

Surrounding Area	**N**	Redhills Quarry/Raceway, Millom beyond: Residential dwellings, commercial premises and green space.
	E	Green space and farmland
	S	Millom Beach, Whiterock Beach and the Duddon Estuary
	W	Haverigg: Residential dwellings, commercial premises and green space

3.0 Site History

A review of the available historical mapping and other information for the site with specific reference to mining activities, as presented within the Envirocheck Report (Ref.1), has been undertaken and is presented in *Table 3.0* below.

Table 3.0 – *Previous Site and Surrounding Area Uses and Potential Sources of Contamination.* ***Bold text refers to on-site activity.***

Date	Description	Potential Sources of Contamination
1850 – 1898	**Earliest mapping records show the site to be largely undeveloped comprising predominantly marshland and part of the estuary except for evidence of mineral extraction. The original channel and path of the 'Brow Deep' is noted cutting through the 'Cockle Beds' and 'Muscle' Beds through the south of the site. The industrial premises of Redhills Quarry (North East) and Hodbarrow Iron Mine (South East) can be seen in the 1867 Historical Map, including the Hodbarrow scar, an engine house, the Old Windmill and a shaft in the South East of the site.** The surrounding area is also largely undeveloped fields with Haverigg to the west and Millom to the north. At this time Haverigg and Millom are small villages with residential housing, farmland and wells. Steel Green, a small housing with a well, is located 850m west of the Redhill Quarry.	• Potential for uncontrolled deposition of Made Ground and mine spoil associated with the construction and workings of the Redhill Quarry and Hodbarrow Iron Mine grounds. • Potential for gas generation from organic soils associated with Marshland and the Duddon Estuary on the southern boundary.
1898 - 1923	**By 1898 Redhill Quarry and Hodbarrow Iron Mine had undergone a significant expansion, with various 'pits' noted across the east of the site and addition of a major rail network, the construction of reservoirs and a number of spoil pits across the East of the site area. The Hodbarrow Lighthouse, later the Hodbarrow Beacon, is constructed in the South East of the site, along with the Hodbarrow Sea Wall extending across to Steel Green.** Steel Green had been expanded with the addition of Hodbarrow Hospital and additional residential dwellings. The Millom Iron Works Railway, Hodbarrow Mines Railway and Furness Railway extend towards the North East, from the Hodbarrow Iron Ore Mines away from the site. Haverigg is shown to have undergone a significant residential expansion with the addition of St. Luke's church, a school and the concrete square. The construction of the Hodbarrow Sea wall redirected the previous Brow Deep river to two new channels called the Duddon Channel and the smaller Swash Channel. The sea wall had also caused the creation of the Duddon sands, a large area of sands previous occupied by the Cocle and Muscle Beds.	• Potential for spillages and leakages of fuel oils used in industry. • Potential for uncontrolled deposition of Made Ground during on site and surrounding area construction. • Potential for gas generation from organic soils associated with the redirection and subsequent silting of the Brow deep to the Duddon Channel and Duddon Sands.

Date	Description	Potential Sources of Contamination
1923 - 1968	**By 1924 the Outer Barrier was constructed at the south of the site, a large seawall extending further out into the Duddon Channel. The sea wall extends between the Peninsular of Hodbarrow to the East and the west end of Moor Bank towards Haverigg, including the new lighthouse constructed within the centre of the barrier. During this time the spoil pit areas increased and a reservoir to the south east of the site is infilled.** The outer barrier construction causes a heathland and marshland to occupy the area inside of the barriered area. With time lakes and ponds form within this area. The presence of the new barrier causes the Duddon channel to be reroute further south towards the estuary mouth. Haverigg continues to expand with residential dwellings, commercial buildings and public spaces.	• Potential for uncontrolled deposition of Made Ground during outer barrier construction. • Potential for gas generation from organic soils associated with suspected infilling of reservoir in the south east of the site.
1968 - 1986	**During 1968 the mine is closed. Anecdotal evidence suggests subsidence of the Inner Sea Barrier caused the collapse and subsequent flooding of the Hodbarrow mine.** **The extensive rail network within the site are dismantled and buildings are disused. Disused spoil pits remain during this time, a slag heap is noted in the east of the site. Buildings surrounding the Arnold and Annie Lowther Pits are dismantled.** **The area behind the outer barrier becomes gravelled and the lighthouse becomes disused.** Large scale dismantling of the mine infrastructure can be seen from the east side of the site to the west, where it joins with the outer barrier. The dismantling in this area includes the mineral railway, shafts and William Pit. Haverigg to the west continues to expand with both commercial and residential buildings, such as a Tannery.	• Potential for uncontrolled deposition of Made Ground during dismantling and demolition of buildings and infrastructure associated with the iron mine and quarry. • Potential for gas generation from organic soils associated with the continued expansion of the marsh. • Potential for ground contamination and gas contamination from the disused spoil and slag pits throughout the site.
1986 - Present	**During 1986 the majority of the site is converted into a Nature reserve. The remaining buildings associated with the mine and quarry workings are dismantled, the majority of spoil and slag pits are removed, reservoirs throughout the site are infilled. One shaft remains depicted within the northern area of the site.** **Tracks are created within the site for walking access. Heritage buildings such as the Old Mill, Hodbarrow Beacon and Hodbarrow Lighthouse remain. The Hodbarrow sea wall is reduced in size to allow the connection between lakes.** The area behind the outer barrier sea wall is flooded to create a large lake area. New areas of land are created for the nature reserve just off the outer barrier and within the northern area of the lake, next to Steel Green. The Port Haverigg Holiday Village and Marine is created on the north and west of the lake. Haverigg continues to expand with additional residential, commercial and holiday homes.	• Potential for uncontrolled deposition of Made Ground during demolition within the site. • Potential for gas generation from organic soils associated with infilling of reservoirs, spoil and slag heaps across the site.

Potential sources of onsite contamination are further discussed in *Section 6.0*.

4.0 Geology, Hydrogeology and Hydrology

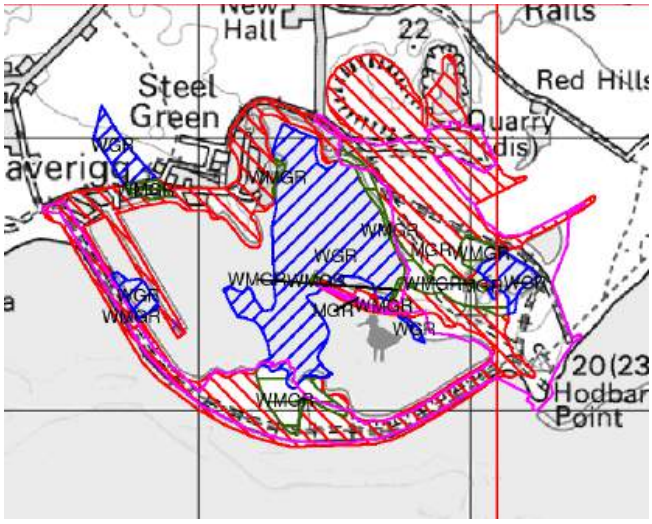
The information presented has been prepared with reference to the following information sources:

- Envirocheck (Ref.1);
- British Geological Society (BGS) 1:50,000 mapping records (Solid) Ulverston Sheet 048 (Ref. 2);
- BGS Borehole Records (opensource website) (Ref. 3);

4.1 Geological Setting

4.1.1 Artificial Ground

Geological Maps indicate the site is heavily worked, as such the presence of Worked and Made Ground is wide spread across the site, as shown in *Figure 4.1.1* below.



Artificial Ground and Landslip

Map Colour	Lex Code	Rock Name	Rock Type	Min and Max Age
	WMGR	Infilled Ground	Artificial Deposit	Not Supplied - Holocene
	WGR	Worked Ground (Undivided)	Void	Not Supplied - Holocene
	MGR	Made Ground (Undivided)	Artificial Deposit	Not Supplied - Holocene

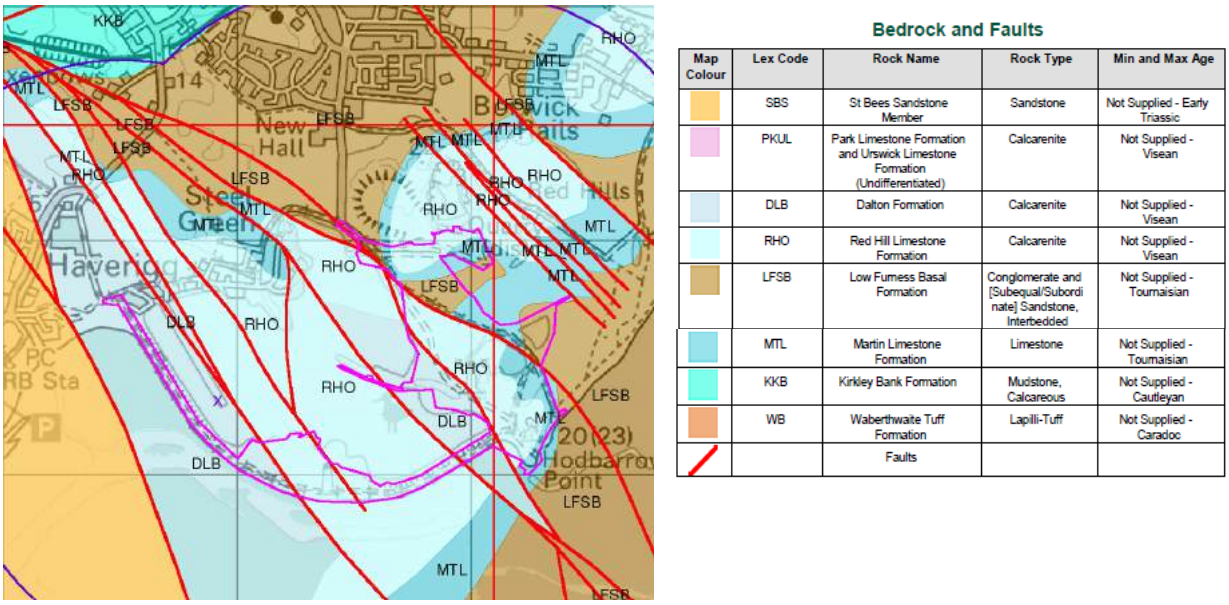
Figure 4.1.1 – *BGS geological mapping extract, 1:50,000 Ulverston (1997) Sheet 048 with Artificial Ground and Landslip Legend relating to the Worked and Made Ground on site included on right hand side. (Purple outline = approximate site boundary).*

4.1.2 Superficial Geology

Geological maps do not indicate the presence of superficial deposits on site.

4.1.3 Bedrock Geology

An extract from BGS mapping for the area are presented in *Figure 4.1.3*



Bedrock and Faults

Map Colour	Lex Code	Rock Name	Rock Type	Min and Max Age
	SBS	St Bees Sandstone Member	Sandstone	Not Supplied - Early Triassic
	PKUL	Park Limestone Formation and Urswick Limestone Formation (Undifferentiated)	Calcarenite	Not Supplied - Visean
	DLB	Dalton Formation	Calcarenite	Not Supplied - Visean
	RHO	Red Hill Limestone Formation	Calcarenite	Not Supplied - Visean
	LFSB	Low Furness Basal Formation	Conglomerate and [Subequal/Subordinate] Sandstone, Interbedded	Not Supplied - Tournaisian
	MTL	Martin Limestone Formation	Limestone	Not Supplied - Tournaisian
	KKB	Kirkley Bank Formation	Mudstone, Calcareous	Not Supplied - Cautleyan
	WB	Waberthwaite Tuff Formation	Lapilli-Tuff	Not Supplied - Caradoc
		Faults		

Figure 4.1.3 – *BGS geological mapping extract, 1:50,000 Manchester (1997) Sheet 048 with Bedrock and Faults Legend relating to rocks underlying site included on right hand side. (Purple outline = approximate site location).*

As illustrated in *Figure 4.1.3*, the bedrock geology comprises of multiple lithologies across the site; the Red Hill Limestone, Martin Limestone Formation, Low Furness Basal Formation and the Dalton Formation. The surrounding area is heavily faulted, generally the faults are shallow dipping 5-15 degrees SW and striking NW-SW, cutting across all lithology types.

Given that multiple major faults are recorded on site and all dip shallowly towards the SW it is considered highly probable to encounter these underneath the site, as well as associated secondary faulting.

A summary of the bedrock geology is presented in ***Table 4.1*** below.

Table 4.1 – *BGS Lexicon of Named Rock Units extract & Hydrogeological Classification*

Lithology Name	Age Range	Thickness	Lithological Description	Associated Hydrogeological Description
Red Hill Limestone Formation	Arundian Substage	20 to 60m	Carbonate bioclastic, intraclastic and peloidid grainstones, coarse-grained and virtually structureless following bioturbation.	Secondary A Aquifer[1]

Lithology Name	Age Range	Thickness	Lithological Description	Associated Hydrogeological Description
Martin Limestone Formation	Tournaisian Stage – Chadian Substage	0 – 135m	Mainly carbonate mudstones, but with significant grainstones, locally cross-bedded, and oolites in upper part; ranges from peritidal to marine. Extensively dolomitized	Secondary A Aquifer[1]
Low Furness Basal Formation	Courceyan Substage – Chadian Substage	0 to more than 200m	Conglomerate, sandstones, siltstones and mudstones with subordinate evaporites, presumed of terrigenous origin in lower part (Duddon Conglomerates). Upper part of limestones and siltstones, mostly red with interbedded conglomerates; all presumed of marine origin.	Secondary A Aquifer[1]
Dalton Formation	Arundian Substage – Arundian Substage	90 – 255m	At base, mid to dark grey even-bedded carbonate grainstones and packstones; middle part, dark grey thinly bedded packstones and wackestones with many shaly interbeds; upper part, even bedded packstones and grainstones.	Secondary A Aquifer[1]

[1] *Secondary A aquifers comprise permeable layers that can support local water supplies, and may form an important source of base flow to rivers.*

The site is not situated within a Source Protection Zone (SPZ).

Groundwater vulnerability has been assessed as high risk*; the site is situated on a Productive Bedrock and Secondary Superficial Aquifer which has well connected fractures, contributing to a high pollutant speed and a dilution of >550mm/year.* There is low soluble rock risk in relation to groundwater vulnerability.

No groundwater abstractions are listed within 1km of the site.

Four pollution incidents to controlled waters are listed within 250m of the site. The nearest of which is listed 133m north-west of site to the River Duddon on 1996 as Category 3 minor incident for organic wastes. All others within 250m are also listed as minor incidents and pre-date this incident.

4.1.4 Mining & Mineral Extraction

The site is not situated within a coal mining reporting area and as such risks associated with **coal mining** are considered **Very Low**.

Iron mining was undertaken at Hodbarrow Iron Mine on site. The mine opened circa 1850 and was in operation until 1868. Online searches suggest surface extraction and shallow mining was undertaken

and that subsidence of historic structures (inner barrier) occurred as a result of underground mining. At present it is unknown if the proposed development area is affected by any shallow mining which may have occurred at Hodbarrow Iron Mine.

There are 8 mine entries recorded within the current development boundary, or within 100m of the site boundary.

The risk from opencast mining is assessed to be **High**. There are 5 no. opencast workings recorded within 500m of the surrounding area, detailed below in Table 4.1.4.

Table 4.1.4 BGS recorded Mineral sites within 500m of the development area.

Site Name	Operator	Distance from Site (m)	Commodity	Status
Red Hills Quarry	Unknown	1	Limestone	Ceased
Red Hills Slag Bank	Millom Aggregates	119	Slag (including basic oxygen slag and electric arc furnace slags)	Ceased
Red Hills Quarry	Unknown	188	Limestone	Ceased
Whitriggs Close Clay Pits	Unknown	300	Common Clay and Shale	Ceased
Whitriggs Close Clay Pits	Unknown	411	Common Clay and Shale	Ceased

The risk associated with non-coal mining and mineral extraction is considered **High**. It is recommended that a detailed mining risk assessment is undertaken ahead of development works to further assess the risk from non-coal mining and mineral extraction on site with respect to the proposed development areas of the wider site.

Hazards associated with mining can be broadly characterised by the following scenarios: deep mining, shallow mining, mine entries, opencast mining, mining geology, mining stability hazards and aggressive ground which should be further considered in a Mining Risk Assessment.

4.2 Borehole Records (Historical)

A review of British Geological Survey (BGS) online opensource borehole records notes 160 boreholes located on or within 500m of the site.

23 no. boreholes are recorded within the site boundary, 21 no. of which are deep boreholes (greater than 30m), 1 no. is moderately deep (between 10 – 30m) and 1 no. is shallow (between 0 – 10m). The boreholes on and around the site were undertaken between 1882 - 1971 depths between 5.0m bgl and 222.99m bgl all of which progressed into the bedrock strata.

The majority boreholes located within 500m of the site are observed within the artificial lake of RSPB Hodbarrow and are therefore unlikely to affect the development of the site into the future.

Bedrock was typically encountered at depths between 31.09m and 64.01m bgl comprising predominantly of Grey Limestone, Red Marl, Red Conglomerate and Iron Ore.

There are 8 boreholes within 250m of the development site and are considered to better inform about the likely underlying geology within the areas of proposed development. The details of these borehole records are given in Table 4.3 below.

Table 4.3 Location and strata details of BGS boreholes within 250m of the development area.

Reference Number	Location	Details
SD17NE 91	British National Grid: 318108,479123 (Approx. 240m northeast)	• Drift (0 – 19.20m) • Grey limestone with jointing and interbedded iron ore
SD17NE 93	British National Grid: 318180,478840 (Approx. 250m southeast)	• Fine sand (0 - 6.10m) • Clay, sand and gravel (6.10 – 32.92m) • Brown Limestone (32.92 – 36.58m) • Conglomerate (36.58m – 49.38m)
SD17NE 94	British National Grid: 318181,478999 (Approx. 240m east)	• Sand and cobbles (0 – 18.29m) • Interbedded grey jointed limestone with ore (18.92 – 60.96m) Ore horizons between 0.3 and 1.22m in thickness • Red sandy Marl (60.96 – 61.87m) • Ore (61.87 – 63.09m) • Red Marl with sandstone (63.09 – 67.06m) • Grey limestone and sandstone (67.06 – 70.10m) • Conglomerate with sandy Marl (70.10 – 103.02m)
SD17NE 106	British National Grid: 317860,479059 (Approx. 70m northwest)	• Limestone with traces of ore (0 – 42.98m) • Dark grey and green shale (42.98 – 45.42m) • Green Limestone (45.42 – 48.16m) • Green Shale (48.16 – 49.68m)
SD17NE 107	British National Grid: 317901,479066 (Approx. 75m north)	• Grey limestone (0 – 43.59m) • Green shale (43.59 – 44.81m) • Reddish limestone with shale (44.81 – 46.33m) • Conglomerate (46.33 – 46.94m) • Limestone with shale (46.94 – 49.68m)
SD17NE 108	British National Grid: 317929,479105 (Approx. 120m northeast)	• Grey limestone (0 – 42.67m) • Green marl with limestone and shale (42.67 – 50.60m) • Reddish limestone and marl (50.60 – 52.12m) • Grey limestone (52.12 – 52.73m) • Brown conglomerate (52.73 – 53.64m)

Reference Number	Location	Details
SD17NE 187	British National Grid: 317869,478723 (Approx. 250m south)	• Drift of sand, peat and sandy loam (0 – 58.83m) • Red conglomerate with sandy marl (58.83 – 115.82m)
SD17NE 196	British National Grid: 317739,478796 (Approx. 220m southwest)	• Drift (0 – 61.87m) • Limestone (61.87 – 64.92m)

Only three of the boreholes within 250m of the development site recorded an indication of ore within the encountered strata. None of the boreholes within 250m of the development recorded evidence of underground workings. However borehole dates vary and are not provided on all records so some are likely to pre date mine working.

4.3 Ground Gas

4.3.1 Radon

The Envirocheck report (Ref. 1) shows three different levels of Radon on site: a lower probability radon area, <1%, to the South East, an intermediate probability area, 3 – 5%, and a higher probability radon area, where 10 to 30% of the area is at or above the action level. It is recommended that each development area is assessed on an individually as some areas will require radon protection measures whereas others may not. BGS radon reports should be procured specific to areas where buildings are proposed.

Where the new development incorporates a basement the advice of a specialist Radon assessor must be obtained.

4.3.2 Landfill

The Envirocheck Report (Ref. 1) show that there are seven recorded Landfill sites within the site and 250m of the site boundary, shown in Table 4.3.2 below.

Table 4.3.2 Recorded Landfill sites within the site boundary.

Site Name	Distance from Site/ Location	Operator / Licence Holder	Site Category & Dates Deposited	Licence Number / Provider Reference	Input Rate	Status
Red Hill	On site (north east)	BGS Recorded	N/A	N/A	N/A	N/A
Redhills Quarry	On site (north east)	Cumbria County Council	Special waste and liquid sludge, 1969-1993	EAHLD07 713	N/A	N/A
Milliom Civic Amenity Site, Redhills Quarry (Licenced)	On Site (north east)	Cumbria Waste Management Ltd	Household waste amenity sites	57294	Unknown	Transferred
Redhills Quarry	139m	Cumbria County Contracting	Special waste and liquid sludge including: Inert, Industrial, Commercial and Household	R20/M4	Medium (Equal to or greater than 25,000 and less than 75,000 tonnes per year)	Licence lapsed (1st June 1991)
Redhills Quarry	139m	Cumbria County Contracting	Special waste and liquid sludge including: Inert, Industrial, Commercial and Household	R20/M4	Medium (Equal to or greater than 25,000 and less than 75,000 tonnes per year)	Record Superseded (1st October 1990)
Redhills Quarry	139m	Cumbria County Contracting	Landfill	R20	Undefined	Record Superseded (1st June 1977)
Millom C.A. Site (Waste Transfer Site)	On site	L&W Wilson (Endmoor) Ltd	Civic Amenity	294/M1	Very Small (Less than 10,000	Operational as far as is known (1st

Site Name	Distance from Site/ Location	Operator / Licence Holder	Site Category & Dates Deposited	Licence Number / Provider Reference	Input Rate	Status
					tonnes per year)	August 1995)

Review of the Envirocheck Report (Ref. 1) has also identified seven areas of potentially infilled land with 500m of the site boundary. Five of these potentially infilled land areas are within the site boundary, all of unknown filled ground (Pit, Quarry etc). The proposed Visitors Centre is situated on or very close to an infilled reservoir associated with Hodbarrow mine. The reservoir first appears on the historical maps in 1900 and was infilled around 1986 when the site was acquired by the RSPB.

4.4 Hydrology

The nearest surface water feature is an unidentified river feature in the south west of site, the RSPB Hodbarrow nature reserve lakes on site and off site, and the tidal Duddon river approximately 16m south from site. There are 23 OS Water Network Lines within 500m of the site.

There have been fourteen pollution incidents to controlled waters within 500m. All but one are classed as Category 3 Incidents (Minor), it is unlikely these will pose any risk to the proposed development. The Category 2 Significant Incident is located 330m northwest of the site at Haverigg Pool, the cause of incident is unknown. The incident occurred on 20th October 1993, incident reference 93210118.

There are seven active discharge consents issued by United Utilities within 500m of the site boundary. These are approximately 326 to 363m north west.

5.0 Unexploded Ordnance Risk Assessment

Military activities including those conducted as part of both the First and Second World Wars have resulted in a legacy of unexploded ordnance (UXO) being present within the shallow soils of the UK.

UXO result from various sources including both allied (military training) and German (bombing raids) with a guide figure of approximately 10% of all munitions failing to function as designed.

An assessment of the likelihood of being UXO encountered has been undertaken to advise any intrusive ground investigation in the event that this is undertaken by Curtins. This risk is influenced by a number of factors including the proximity to strategic targets, the nature of the works being undertaken and evidence of local damage in the post-war periods amongst others. In order to determine the likelihood of UXO being present on a site, a stepwise risk assessment process is followed. This process is outlined within CIRIA C681 Unexploded Ordnance: A Guide for the Construction Industry (Ref. 6). with the following commentary considered to represent a Preliminary Risk Assessment intended to guide if and where there is a requirement for a Detailed Risk Assessment.

5.1 Preliminary UXO Assessment

The risk presented by Unexploded Ordnance, identified using preliminary Unexploded Bomb (UXB) risk maps retrieved from Zetica UXO (Ref. 7) has placed the site in a Low-risk area in respect to the potential presence of UXB as a result of World War Two bombing. Low-risk regions are those with a bombing density of less than 15 bombs per 1000 acres. A Luftwaffe target and industry is noted on risk maps circa 1km north east of the site.

A review of the available historic mapping did not identify the presence any ruins or features indicative of bomb damage following WWII within or close to the site boundary.

Considering the above and the generally limited development in the wider area around the site prior and during WWII, the risk of encountering potential UXO as part of Curtins ground investigation works is considered **Low**, and no further action is required.

If unexploded ordnance is discovered during any works, stop immediately, prevent access to the area, and inform the police. If the site boundary or location changes then the UXO risk should be reassessed.

6.0 Conceptual Site Model & Qualitive Risk Assessment

The conceptual site model (CSM) and Qualitative Risk Assessment (QRA) are presented in the table presented in this section.

The CSM details the source-pathway-receptor linkages or potential pollutant linkages (PPL) that have been identified for the site. The QRA details the associated level of risk relating to these potential pollutant linkages.

The CSM and QRA concern risk to human health and water environment with additional, more specific risk assessment protocols contained within the main body of this reporting, as detailed in Section 3.1 below.

The QRA follows the framework outlined within CIRIA C552 (Ref. 8) which is summarised within *Appendix C.*

The 'risk rating' within the QRA refers to the risk that the source, pathway, receptor linkage or PPL is complete. Unless specifically stated it does not necessarily refer to an immediate risk and is intended to be used as a tool to assess the necessity for further assessment/investigation.

6.1 Additional Risk Assessments

The following risk assessments, listed below, are not included within the main CSM and QRA but none-the-less can be of critical importance to the onward development of the site.

- The risk posed by Radon is discussed and assessed in Section 4.3.1.
- The risk posed by Unexploded Ordnance (for Curtins ground investigation works only) is discussed and assessed in Section 5.1.
- The risk posed by historic mining on site is discussed and assessed in Section 4.1.4.

Under current health and safety legislation, employers are required to carry out their own appropriate risk assessments and mitigation to protect themselves and their employees, other human receptors and the environment from potential contamination. Such risks must be adequately mitigated by law, specifically the Construction Design Management (CDM) Regulations (2015) (Ref. 9) which require that potential risks to human health and the environment from construction activities are appropriately identified and all necessary steps taken to eliminate / manage that risk. It has been assumed that any future construction works on site will be undertaken in compliance with these requirements and therefore construction workers involved in the building works at the site have been discounted as a human receptor in the conceptual site model.

Qualitative Risk Assessment → Generic Quantitative Risk Assessment → Detailed Quantitative Risk Assessment or; Remedial Action

The table below represents the first stage in the land quality risk assessment process: The Qualitative Risk Assessment. In order for a development site to be deemed 'suitable for use', the level of risk needs to be brought down to acceptable levels, i.e. low to negligible risk. The purpose of each stage of risk assessment is ultimately to establish, if there is a requirement for additional levels of assessment to be made in order to have sufficient confidence to support a risk characterisation or management decision, e.g. remedial action. In the absence of specific site data a Generic Quantitative Risk Assessment is invariably recommended.

Conceptual Site Model			Qualitative Risk Assessment			Recommended Actions
Source	**Pathway(s)**	**Receptor(s)**	**Consequence (with explanations, if applicable)**	**Likelihood of Occurrence (with explanations if applicable)**	**Risk Rating**	
On site sources of potential contamination: Uncontrolled deposition of Made Ground during construction and demolition previously undertaken on site. Uncontrolled deposition of spoil associated within mining and mineral extraction. Unknown contamination associated with the sites former industrial use, may include leakages and spillages from plant and machinery. Various landfills on site.	**Direct contact, ingestion, inhalation (dust and vapours)**	**Site end users** Site staff	**Medium** Chronic health risk	**Likely** The site historically was partially Hodbarrow Iron mine. The site was also occupied by the Redhills limestone quarry. Various landfills on site and infilled land. The proposed end use is commercial/educational, the sensitivity of potential receptors is relatively low.	**Moderate**	**Ground Investigation** Including soil sampling **GQRA as part of Ground Investigation**
	Vertical migration through the weathered bedrock (soils) May occur due to processes including; capillary action, burrowing animals inducing soil mixing and downwards into the natural deposits through infiltration.	**Controlled Waters** Bedrock hosts Secondary A aquifer.	**Medium** Pollution of sensitive water resources	**Likely** Moderate levels of contamination are anticipated on-site. Groundwater vulnerability on-site has been assessed as high. Granular geology anticipated may act as a potential pathway to the principal aquifer.	**Moderate**	**Ground Investigation** **GQRA as part of Ground Investigation**

Conceptual Site Model			Qualitative Risk Assessment			Recommended Actions
Source	**Pathway(s)**	**Receptor(s)**	**Consequence (with explanations, if applicable)**	**Likelihood of Occurrence (with explanations if applicable)**	**Risk Rating**	
	Horizontal migration through preferential pathways in the underlying bedrock May occur due to influence of perched or natural groundwater flow patterns and natural or man-made high permeability zones, e.g. fractures or drainage runs.	**Controlled Waters** Nearest surface water feature is the RSPB Hodbarrow nature reserve lakes, a River feature in the south west and the tidal Duddon river approximately 16m south from site.	**Medium** Pollution of sensitive water resources Pollution of sensitive water resources	**Likely** As noted above there are potential sources of contamination at the site which could impact the source given the distance from site.	**Moderate**	**Ground Investigation** **GQRA as part of Ground Investigation**
Off-site sources of potential contamination: Uncontrolled deposition of Made Ground during construction and demolition off site. Uncontrolled deposition of spoil associated within mining and mineral extraction. Unknown contamination associated with current former industrial use, may include leakages and spillages from plant and	**Horizontal migration through the superficial deposits and air (dust/particulates)** Followed by… **Direct contact, ingestion, inhalation (dust and vapours)**	**Site end users** Site staff	**Medium** Chronic health risk	**Low** The realisation of a source – pathway – receptor linkage between the site soils and any of these potential sources of contamination is assessed as being Low however cannot be discounted at this stage.	**Moderate/ Low**	**Ground Investigation** **GQRA as part of Ground Investigation**

Conceptual Site Model			Qualitative Risk Assessment			Recommended Actions
Source	**Pathway(s)**	**Receptor(s)**	**Consequence (with explanations, if applicable)**	**Likelihood of Occurrence (with explanations if applicable)**	**Risk Rating**	
machinery. Current use includes Redhill quarry immediately north of site. Various landfills off site.						
On and off-site soils with the potential to generate ground gases Made Ground deposits on and off site mostly related to phases of redevelopment in the surrounding area. Organic deposits within marshland and reclaimed land. Infilled reservoirs and areas of potential infilled land. Six landfills within 250m of the site boundary including landfills on north east of site.	Vertical and horizontal migration through the superficial and bedrock deposits	**Site end users** Site staff and students.	**Medium** Chronic health risk	**Likely** There may be inclusions within the site soils on site capable of gas generation including various historic landfills.	**Moderate**	**Ground Gas Monitoring as part of ground investigation**

7.0 Potential Geohazards

The following geohazards have been identified following a review of the geological, historical, and environmental information.

- Potential for soft / loose organic soils associated with marshland with a low bearing capacity and potential for excessive settlement.
- Potential for Made Ground associated with mining / structures and landfilling. Made Ground is considered to be an unsuitable founding stratum, due to its poor geotechnical properties, variability, and compressibility particularly where landfills are present.
- Potential for unrecorded mine shafts.
- Infilled pits / reservoirs may contain deep Made Ground which may preclude the use of shallow foundations.
- Potential for buried infrastructure and obstructions associated with structures such as reservoirs and the railway.
- Potential for subsidence / collapse associated with underground iron mining.
- Potential for aggressive ground conditions with regards to chemical attack on buried concrete.
- Potential for fractured bedrock associated with fault zones.
- Potential for ground movement where building adjacent to former quarry highwall/pond

8.0 Conclusion and Recommendations

The qualitative risk assessment (QRA) determined a varied level of level of risk associated ground/groundwater contamination and ground gas risk with respect to the proposed development, Moderate to Low to Moderate risks were identified for potential contaminant linkages. The QRA concluded by recommending that generic quantitative risk assessments (GQRA) were conducted to confirm the assessment of risk ascribed to each of the respective potential pollutant linkages (PPLs). It is recommended that the GQRA is conducted as part of a ground investigation in support of the engineering design of the proposed development.

Initial assessment of available data suggests it is highly likely to have Iron ore mine workings or mine entries beneath areas of the site. It is recommended that a mining risk assessment is conducted followed by appropriate ground investigation;

Risks are likely to be higher in some parts of the site than others, however in summary, the following recommendations are made for development on the site:

- Undertake a Detailed Mining Risk Assessment for the site/ development areas to categorise and understand the extent of mining risk pertaining to the development area. As part of this mine plans and other mining records pertinent to the proposed development site should be obtained where possible;
- Depending on the findings of the Detailed Mining Risk Assessment, undertake an intrusive ground investigation to determine the extent of shallow mining under the footprint of the proposed development area;
- Undertake an intrusive ground investigation to determine foundation solutions and other geotechnical design parameters.
- Undertake an intrusive ground investigation to determine extent of contamination, for soil and water;
- Undertake a GQRA as part of the ground investigation;
- Procure BGS radon report specific to areas of the site where buildings are proposed;
- Undertake ground gas monitoring over a period of three months for potential hazardous gases;
- The Mining Risk Assessment should be further updated following completion of an intrusive investigation.
- Subject to findings of ground investigation, undertake a Remediation Strategy outlining required remedial actions and subsequent validation/completion report.

It is further recommended that the site investigation works are completed in advance of any development works taking place.

8.1 Contaminants of Concern

Potential contaminants of concern associated with the sources identified within the Conceptual Site Model in *Section 6.0* of this reporting include but are not limited to: broad range aliphatic and aromatic

hydrocarbons present within any fuel oils; polycyclic aromatic hydrocarbons (PAHs); inorganic compounds including heavy metals; and asbestos present in discarded building materials.

Potential contaminants associated with the airborne dust/particulates include but are not limited to: polycyclic aromatic hydrocarbons and inorganic compounds including toxic metals that are also accounted for by potential onsite contaminants of concern.

8.2 Other Considerations

The site is a Site of Special Scientific Interest (SSSI), Ramsar Site, Special Protection Area and Special Area of Conservation. Heritage structures on site may be protected. Appropriate stakeholders should be consulted ahead of GI works.

The requirement for additional surveys, e.g. arboricultural, heritage and ecological surveys, should be confirmed through advice from a suitably qualified and experienced professional.

The Gin Mill, Steel Green
MILLOM
LA18 4LG

Client Details:

Mr R Taylor
Curtins Consulting Ltd
Merchant Exchange
17-19 Whitworth Street West
Manchester
M1 5WG

Contents

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.
In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Report Version v53.0

Summary

Data Type	Page Number	On Site	0 to 250m	251 to 500m	501 to 1000m (*up to 2000m)
Agency & Hydrological					
BGS Groundwater Flooding Susceptibility	pg 1	Yes	Yes	Yes	n/a
Contaminated Land Register Entries and Notices					
Discharge Consents	pg 4			7	6
Prosecutions Relating to Controlled Waters			n/a	n/a	n/a
Enforcement and Prohibition Notices					
Integrated Pollution Controls					
Integrated Pollution Prevention And Control					
Local Authority Integrated Pollution Prevention And Control					
Local Authority Pollution Prevention and Controls					
Local Authority Pollution Prevention and Control Enforcements					
Nearest Surface Water Feature	pg 7	Yes			
Pollution Incidents to Controlled Waters	pg 8		4	10	2
Prosecutions Relating to Authorised Processes					
Registered Radioactive Substances					
River Quality	pg 10			1	1
River Quality Biology Sampling Points					
River Quality Chemistry Sampling Points					
Substantiated Pollution Incident Register	pg 11				1
Water Abstractions					
Water Industry Act Referrals					
Groundwater Vulnerability Map	pg 11	Yes	n/a	n/a	n/a
Groundwater Vulnerability - Soluble Rock Risk	pg 14	6	n/a	n/a	n/a
Groundwater Vulnerability - Local Information			n/a	n/a	n/a
Bedrock Aquifer Designations	pg 14	Yes	n/a	n/a	n/a
Superficial Aquifer Designations	pg 14	Yes	n/a	n/a	n/a
Source Protection Zones					
Extreme Flooding from Rivers or Sea without Defences	pg 15	Yes	Yes	n/a	n/a
Flooding from Rivers or Sea without Defences	pg 15	Yes	Yes	n/a	n/a
Areas Benefiting from Flood Defences	pg 16	Yes	Yes	n/a	n/a
Flood Water Storage Areas				n/a	n/a
Flood Defences				n/a	n/a
OS Water Network Lines	pg 16		4	19	4

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.
The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Cumberland

Published 1862

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Lancashire And Furness

Published 1850

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

10k Raster Mapping

Published 2001

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey`s 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2022

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities),1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Cumberland

Published 1862

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Large-Scale National Grid Data

Published 1994

Source map scale - 1:2,500

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1994

Source map scale - 1:2,500

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Cumberland

Published 1862

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Cumberland

Published 1862

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Cumberland

Published 1898 - 1899

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Appendix C Qualitative Risk Assessment Rationale

The site-specific risk assessment, presented in this report, follows the principle of establishing whether there is a viable linkage between a contaminant source to a potential receptor, via an exposure pathway.

The risk assessment corresponds with the total site area and incorporates both descriptive (qualitative) and, where available, numerical (quantitative) lines of evidence.

Risk assessment is the process of collating known information on a hazard or set of hazards to estimate actual or potential risk to receptors. The receptor may be humans, a water resource, a sensitive local ecosystem or future construction materials. Receptors can be connected to the source by one or several exposure pathways such as direct contact for example. Risks are generally managed by isolating the receptor or intercepting the exposure pathway or by isolating or removing the hazard.

Without the three essential components of a source, pathway and receptor there can be no risk. Therefore, the presence of contaminant source on a site does not necessarily mean there is a risk.

The risk assessment considers the likelihood of an event taking place (accounting for the presence of the source and receptor and the viability of the exposure pathway) in conjunction with the severity of the potential consequence (accounting for the potential severity of the hazard and the sensitivity of the receptor).

In the risk assessment, the consequence of the hazard has been classified as severe or medium or mild or minor and the probability (likelihood) of the circumstances occurring classified as high likelihood or likely or low likelihood or unlikely.

The consequences and probabilities are subsequently cross-correlated to give a qualitative estimation of the risk using Department of the Environment risk classifications as detailed in the table below and as referenced in CIRIA C552.

		Consequence			
		Severe	**Medium**	**Mild**	**Minor**
Probability (Likelihood)	**High Likelihood**	Very High Risk	High Risk	Moderate Risk	Moderate/Low Risk
	Likely	High Risk	Moderate Risk	Moderate/Low Risk	Low Risk
	Low Likelihood	Moderate Risk	Moderate/Low Risk	Low Risk	Very Low Risk
	Unlikely	Moderate/Low Risk	Low Risk	Very Low Risk	Very Low Risk

In accordance with DoE guidance, the following categorisation of **consequence** has been developed.

Classification	Definition	Examples
Severe	Short-term (acute) risk to human health likely to result in "significant harm" as defined by the Environment Protection Act 1990, Part IIA. Short-term risk of pollution of sensitive water resource. Catastrophic damage to buildings/property. A short-term risk to an ecosystem or organisation forming part of such ecosystem.	High concentrations of cyanide on the surface of an informal recreation area. Major spillage of contaminants from site into controlled water. Explosion, causing building collapse (can also equate to a short-term human health risk if buildings are occupied).
Medium	Chronic damage to Human Health. Pollution of sensitive water resources. A significant change in an ecosystem or organism forming part of such ecosystem.	Concentration of a contaminant from site exceeds the generic or site-specific assessment criteria. Leaching of contaminants from a site to a Principal or Secondary A aquifer. Death of a species within a designated nature reserve. Lesser toxic and asphyxiate effects
Mild	Pollution of non-sensitive water resources. Significant damage to crops, buildings, structures and services. Damage to sensitive buildings/structures/services or the environment.	Pollution of non-classified groundwater (inc. Secondary B aquifers). Damage to building rendering it unsafe to occupy (e.g. foundation damage resulting in instability).
Minor	Harm, although not necessarily significant harm, which may result in a financial loss or expenditure to resolve. Non-permanent health effects to human health (easily prevented by means such as personal protective clothing, etc). Easily repairable effects of damage to buildings, structures and services.	The presence of contaminants at such concentrations that protective equipment is required during site works. The loss of plants in a landscaping scheme. Discoloration of concrete.

In accordance with DoE guidance, the following categorisation of **probability** has been developed.

Classification	Definition
High Likelihood	There is a pollution linkage and an event that either appears very likely in the short term and almost inevitable over the long term or there is evidence at the receptor of harm or pollution.
Likely	There is a pollution linkage and all the elements are present and in the right place, which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short term and likely over the long term.
Low Likelihood	There is a pollution linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a longer period such event would take place and is less likely in the shorter term.
Unlikely	There is a pollution linkage, but circumstances are such that it is improbable that an event would occur even in the very long term.

In accordance with DoE guidance, the following categorisation of **risk** has been developed.

Classification	Definition
Very High Risk	There is a *high probability* that *severe harm* could arise to a designated receptor from an identified hazard at the site without appropriate further action.
High Risk	*Harm* is *likely to arise* to a designated receptor from an identified hazard at the site without appropriate further action.
Moderate Risk	*It is possible* that without appropriate further action *harm could arise* to a designated receptor. It is relatively *unlikely* that any such harm would be *severe,* and if any harm were to occur it is *more likely* that such harm would be *relatively mild.*
Low Risk	*It is possible* that *harm could arise* to a designated receptor from an identified hazard. It is *likely* that, at worst, if any harm was realised any effects would be *mild.*
Very Low Risk	The presence of an identified hazard does not give rise to the potential to cause harm to a designated receptor.

The term ‘risk’ in this instance refers to the risk that the source, pathway, receptor linkage for a given source of contamination is complete. It does not refer to immediate risk to individuals or features present on the site from potential contaminants and is intended to be used as a tool to assess the necessity of further investigation.

Our Locations

Birmingham
2 The Wharf
Bridge Street
Birmingham
B1 2JS
T. 0121 643 4694
birmingham@curtins.com

Bristol
